

As a regular user of 160 meters for more than three years may I express my strong support in favor of RM-10352. Separation of narrowband (CW and digital) from wideband (SSB, SSTV and AM) modes through FCC rules has worked well for the HF bands. With the increased utilization of the band that I am already seeing and that surely will continue as we move toward the next solar minima, it seems highly desireable to implement FCC rules that will encourage the most efficient use of this unique portion of the amateur radio spectrum. From a practical standpoint narrowband, especially weak signal CW signals, can only realize their efficient use of the spectrum if they are separated from wideband signals. Thank you for your consideration of this matter.
